

VIETILE NOASTRE S-AU SCHIMBAT

Ochii: Una dintre cele mai importante zone de patrundere a COVID-19

“Ochii sunt o parte importantă a corpului de protejat, deoarece, la fel ca nasul și gura, sunt mucoase unde germenii pot infecta organismul”, spune dr Ruchman.” Virusul se răspândește atunci când picăturile infectate de la gura sau nasul unei persoane bolnave intră în contact cu chipul altei persoane, adesea când tusec, stranută sau vorbesc. Deși este mai probabil să fii infectat prin inhalarea acestor picături prin gură sau nas, ele pot intra și prin ochi, mai ales dacă atingi ceva care are particule virale și apoi îți atingi ochii. ”

De ce tinem cont cand alegem protectia ochilor impotriva COVID-19- si nu numai

- Tratament superior anti aburire
- Protectie laterala
- Etanseitate
- Tip ventilatie adecvat riscurilor
- Purtatorul are nevoie de dioptrii

De ce Blue Block?

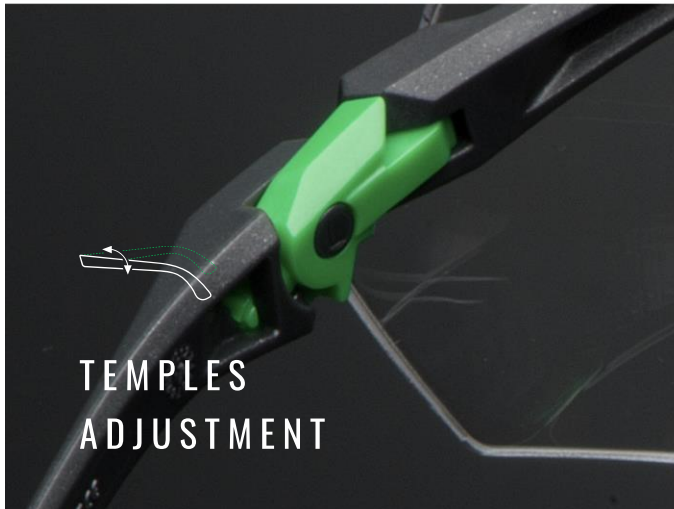

Stiati ca... Lumina albastra vizibila de catre ochiul uman opereaza in frecvente inalte de la 380-450 nm, intervalul cel mai periculos pentru ochi.

Lentilele Blue Block diminueaza substantial impactul luminii albastre, blocand frecventele pana la 420 nm. Blocarea completa nu se poate realiza, deoarece ar implica imposibilitatea vizualizarii si alterarea perceptiei.

Aceasta cauzeaza dureri de cap, oboseala, uneori asociate cu alte simptome- vedere incetosata, senzatia de ochi uscati, vedere dubla, sensibilitate la lumina.

FRAME TECHNOLOGIES

Noii 5x1 zero noise- ideali in combinatie cu castile de protectie auditiva

TEST	NOISE LEVEL [dB]	ATTENUATION [dB]	LOSS OF ATTENUATION [dB]
No ear muff	95.0	-	-
With ear muff	71.0	24.0	-
Ear muff + glasses	81.3	13.7	-43 %
Ear muff + 5X1 Z	74.8	20.2	-16 %

Testele de laborator certifica faptul ca noii 5x1, in combinatie cu castile de protectie auditiva, ofera o atenuare substantiala a zgomotului si o protectie impecabila a ochilor.
